

AI-Enabled FP&A; Automation Platform

Portfolio Case Study | Excel + Power Query + Three-Statement Modeling + Rolling Forecast + Generative AI

Objective. Build a controlled FP&A; workflow that reduces manual handoffs between source-data exports, financial models, variance analysis, forecasting, dashboards, and management commentary.

The application keeps Excel as the auditable financial engine while using automation to move actuals through mapping and staging, update an integrated three-statement forecast, surface material exceptions, and prepare validated outputs for AI-assisted commentary.

<

Business Problem

Monthly FP&A; processes frequently require analysts to export actuals, map accounts, rebuild variance files, update forecasts, reconcile statements, refresh dashboards, and then draft management commentary. Each manual transition creates both cycle-time and control risk.

Solution Architecture

ERP / GL CSV	Power Query	Mapping + Staging	3 Statements	BvA + Forecast	Dashboard + AI
Source actuals	Refresh / typing	Governed classification	IS / BS / CF	Variance intelligence	Executive insight

What the Application Demonstrates

Capability	Portfolio Signal
Power Query actuals workflow	Repeatable ingestion and governed refresh design
Account mapping + staging	Data governance and financial-statement classification
Integrated three-statement model	Core corporate-finance modeling and statement linkage
Budget vs. Actual + rolling forecast	FP&A planning, materiality, and forecast re-estimation
Executive dashboards + controls	Management reporting and auditability
AI-assisted commentary	Responsible use of AI downstream of validated financial outputs

How the Monthly Workflow Operates

The portfolio demo is designed to be understood in roughly one minute.

1	Replace / refresh actuals	Drop the new source export into the governed refresh workflow.
2	Validate the feed	Confirm row count, latest period, zero unmapped accounts, and READY status.
3	Advance the close	The Close Through control determines which months are actual versus forecast.
4	Review exceptions	Material BvA items are classified as favorable, unfavorable, or derived.
5	Reforecast the year	Future periods respond to YTD revenue realization, margins, and run rates.
6	Communicate results	Dashboards update and validated outputs feed an AI management-commentary prompt.

Budget vs Actual Variance Output FY2024 v1.1.1												
Detailed description of the table content: This table provides a comprehensive breakdown of budget versus actual variance for FY2024. It includes columns for Month, Status, Revenue Budget, Revenue Actual, Rev % Var, EBITDA Budget, EBITDA Actual, EBITDA % Var, Net Income Budget, Net Income Actual, Net Income % Var, and Variance. The data is organized by month from Jan to Dec, with a final summary row for the year. Variance is color-coded: Green for favorable, Red for unfavorable, and Grey for derived.												
Month	Status	Revenue Budget	Revenue Actual	Rev % Var	EBITDA Budget	EBITDA Actual	EBITDA % Var	Net Income Budget	Net Income Actual	Net Income % Var	Variance	Monthly Action Items
Jan-24 Actual	Actual	\$1,400	\$1,400	0.0%	\$0.00	\$0.00	0.0%	\$0.00	\$0.00	0.0%	\$0.00

Notes	Status Legend: OK = within tolerance FAVORABLE/UNFAVORABLE = EBITDA management variance DERIVED = downstream variance, not a separate real source CORRECTED = manually corrected with ledger performance											

Design Principles

Finance remains the source of truth.	AI does not calculate or override the controlled statements.
Exceptions are governed.	Unmapped accounts, failed ties, and material variances are surfaced before management use.
The forecast evolves with actual performance.	Closed months lock to actuals; future months respond to current performance.
The model is transparent.	Inputs, cross-sheet links, formulas, and external references use financial-modeling conventions.

Portfolio Positioning

Resume summary: Built an AI-enabled FP&A; automation platform in Excel integrating Power Query-based ERP/GL ingestion, automated account mapping and staging, three-statement forecasting, Budget vs. Actual variance analysis, rolling forecasts, executive dashboards, financial controls, and AI-assisted management commentary.
